

a Support and query cells are physically disjoint
Eight held-out species; ten fixed-seed support draws at each budget

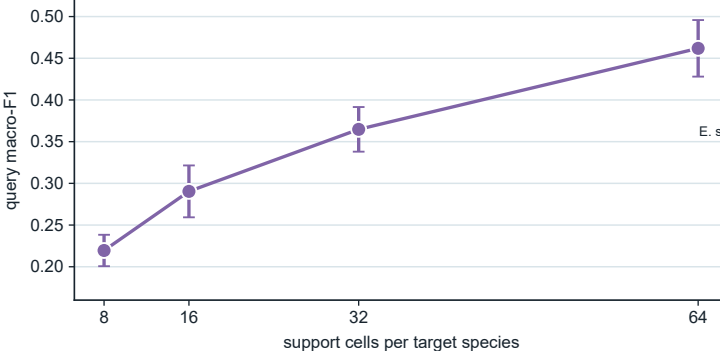

b Adaptation improves monotonically with a small labelled support set
The 64-cell setting reaches 75.89% mean query all-cell accuracy

c Fine-label recovery follows the same dose response

Macro-F1 is reported separately from the all-cell headline

d Species-specific gains remain visible

Rows marked with * in the paper are single-label public records
