

a A matched frozen scPlantLLM reference is now auditable
Same GSE270342 object, first-target mapping and exact Plant-CellFM locked test barcodes

No scPlantLLM fine-tuning occurs; this is a frozen representation readout only.

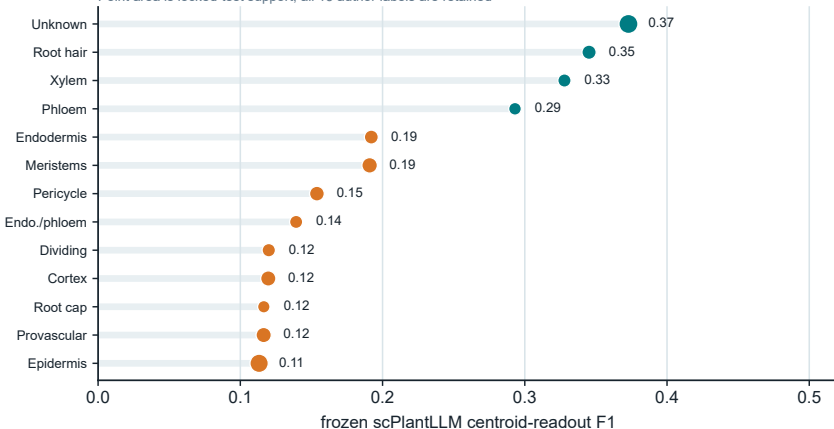

b Locked-test reference metrics
1,433 cells; labels used only to train the centroid on 5,014 training cells

Checkpoint: 0 missing keys / 0 unexpected keys

c Per-class behaviour remains visible rather than summarized by one score

Point area is locked-test support; all 13 author labels are retained

d Comparator boundary

This closes a matched frozen-reference gap, not the full head-to-head question
