

a Support and query cells are disjoint

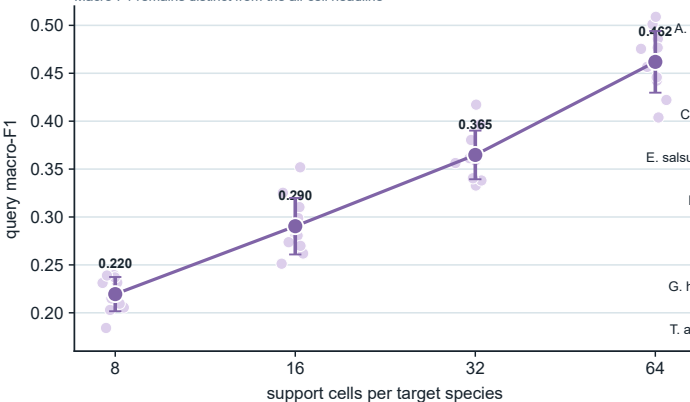

Eight held-out species; ten fixed support draws per budget

**b Small labelled support produces a repeatable adaptation dose response**

64 support cells per species: 75.89% mean query all-cell accuracy

**c Fine-label recovery follows the same support response**

Macro-F1 remains distinct from the all-cell headline

**d Species gains remain inspectable**

† query label space has one class; retained as low-information
